

Lec-14

① Multi-Level Queue scheduling (MLQ)

- ① system process : Created by OS
- ② Interactive process :- user input required,
(foreground)
- ③ Batch process :- X I/P No I/P
(Background)

$SP > IP > BP$

* Multi-level feedback Queue scheduler

- Multiple sub Queues
- Inter queue movement is allowed.
- Separate process based on BT.
- BT \uparrow \rightarrow Lower Queues
- I/O bound & interactive process
higher priority.
- Ageing method $\text{Lower}^{\text{priority}}$ process
Promote \uparrow .
- flexible
- Configurable OS design

Design of MLFQ =

- ① No. of Queues.
- ② Scheduling Algo in each Q.
- ③ method to upgrade a process to a higher Queue.
- ④ demote a process to lower priority.
- ⑤ Process $P_i \rightarrow$ which Queue will it be pushed.
